Using the Twitter API

The Twitter API can be used to programmatically retrieve and analyze data, as well as engage with the conversation on Twitter.

This API provides access to a variety of different resources including the following:

- Tweets
- Users
- Direct Messages
- Lists
- Trends
- Media

How to get access to the Twitter API

Step one: Apply and receive approval for a developer account

To make any request to the Twitter API, you must first apply for a developer account, and have your use case approved. Once approved, you can create a Project and connect an associated developer App which will provide you a set of credentials that you will use to authenticate all requests to the API.

We require an approved use case, authentication and App authorization from Twitter users when making OAuth 1.0a User Context, to protect the people that use Twitter. Before you apply, we strongly encourage you to understand our developer policy, and to review our list of restricted use cases. If your use case does not adhere to our policy, we will reject your application.

Apply for a developer account ❯

Please note: We launched a new developer portal experience in July 2020. If you have an existing developer account, you can opt into this new portal experience and create a Project and App to access the Twitter API v2 endpoints and features.

For developers with Twitter Apps pre-dating July 2018, note that an approved developer account is required to
